### Policy for Efficient Use of Resources

We are aware of the fact that the global environmental problems basically arise from the lack of efficient and proper use of the natural resources.

Accordingly;

- We take care to use our resources wisely by taking into account the effectiveness of raw materials, power and water within all processes under our management.
- We make needs and risk analyses within the scope of the sense of resource efficiency and we try to ensure that the scarce and exhaustible resources are used more effectively.
- We conduct awareness raising activities with the technological infrastructure in order to use the planet and water efficiently, which is the most important aspect of our ability to perform our service.
- We prevent the inputs of our projects from being wasted by using them fully and completely.
- We take care to perform the projects in compliance with recycling and to ensure that they are an input of the circular economy as well as making use of the residuals and wastes of the projects within the recycling system.
