Primary Emission Policy

The Paris Convention has set a global target to achieve net zero emission by 2050. If we want to avoid from the adverse effects of the climate change, we must limit the global average temperature increase to 1.5°C. As a species, our final target must be to make a rapid progress towards a society with net zero emission by 2050.

The Company carries out practices on the following issues within the scope of its management authority in its projects:

- To take into consideration the energy efficiency and resource efficiency in the project production
- To maintain the innovativeness approach in the production
- To use recyclable materials
- To carry out the waste and residual efficiency activities
- To conduct afforestation activities in the regions where the operations are carried out
- To support the non-governmental organizations in relation to afforestation
- To carry out the information activities for the employees and the supply chain
- To work with the suppliers that will contribute to the greenhouse gas emission targets
- To take into account the generation of emission and to work with the local manufacturers as far as possible in the arrangement of logistics operation
- To incorporate the cyclical economy into the business processes for the transition to the low carbon economy
- To discipline all operation processes as per the international standards in order to achieve the carbon positive target by 2050
- To set targets, to make commitments and to make schedule for the key emissions
- To develop a technological infrastructure for the measurement and management of the effect of emissions
- To report NO_x, SO_x and other particle emissions and to control NO_x, SO_x and other particle emissions
